

ABSTRACT OF THE DISCLOSURE

5 The present invention is provided with a treatment
section provided at the distal end of an insertion
section insertable into a body cavity, and being
10 openable/closable and rotatable from side to side and
up and down, an operation section provided at the
proximal end of the insertion section and being
openable/closable and rotatable from side to side and
upward or downward, and first to third driving rods
15 which connect the treatment section and the operation
section together and which can be advanced or
retracted. The present invention is characterized in
that the opening/closing operation of the first and
second handles causes the advancing/retracting movement
20 of the driving rod, thereby opening or closing the jaws
of the treatment section, and in that the rotation of
the operation section causes the advancing/retracting
movement of the driving rod, thereby rotating the
treatment section relative to the axis of the insertion
section.
